About the Lab

These lab notes are to support the instructional videos with AWS in the BackSpace AWS Certified Associate preparation course.

Please refer to the AWS JavaScript SDK documentation at:

<http://docs.aws.amazon.com/AWSJavaScriptSDK/latest/AWS/S3.html>

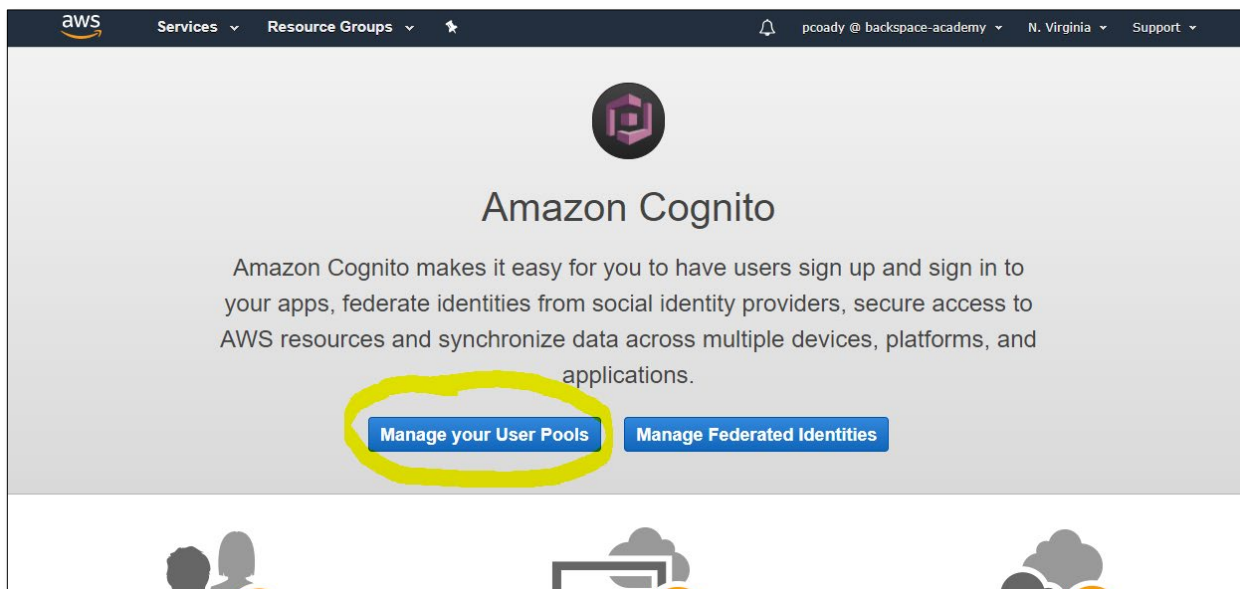

Please note that AWS services change on a weekly basis and it is extremely important you check the version number on this document to ensure you have the latest version with any updates or corrections. The videos may not be as current as these lab notes so please follow these lab notes carefully.

▶ Creating a Cognito User Pool

In this section we will use the Cognito service to create a user pool of authenticated users.

Select the Cognito Console.

Click “Manage your User Pools”

Click “Create a user pool”

Give your user pool a name

Click “Step through settings”

Create a user pool

Name
Attributes
Policies
MFA and verifications
Message customizations

Review

How do you want your end users to sign in?

You can choose to have users sign in with an email address, phone number, username or preferred username plus their password. [Learn more.](#)

☒ **Username** - Users can use a username and optionally multiple alternatives to sign up and sign in.

☒ Also allow sign in with verified email address

☐ Also allow sign in with verified phone number

☐ Also allow sign in with preferred username (a username that your users can change)

☐ **Email address or phone number** - Users can use an email address or phone number as their "username" to sign up and sign in.

☐ Allow email addresses

☐ Allow phone numbers

☐ Allow both email addresses and phone numbers (users can choose one)

Add some attributes you want to collect for the user

Which standard attributes do you want to require?

All of the standard attributes can be used for user profiles, but the attributes you select will be required for sign up. You will not be able to change these requirements after the pool is created. If you select an attribute to be an alias, users will be able to sign-in using that value or their username. [Learn more about attributes.](#)

Required	Attribute	Required	Attribute
<input type="checkbox"/>	address	<input type="checkbox"/>	nickname
<input checked="" type="checkbox"/>	birthdate	<input type="checkbox"/>	phone number
<input checked="" type="checkbox"/>	email	<input type="checkbox"/>	picture
<input checked="" type="checkbox"/>	family name	<input checked="" type="checkbox"/>	preferred username
<input checked="" type="checkbox"/>	gender	<input type="checkbox"/>	profile
<input checked="" type="checkbox"/>	given name	<input type="checkbox"/>	zoneinfo
<input type="checkbox"/>	locale	<input type="checkbox"/>	updated at
<input type="checkbox"/>	middle name	<input checked="" type="checkbox"/>	website
<input type="checkbox"/>	name		

Click "Add custom attribute"

Add a custom attribute name "linkedin" you want to collect for the user

Click "Next step"

Do you want to add custom attributes?

Enter the name and select the type and settings for custom attributes.

Type	Name	Min length	Max length	Mutable
string	linkedin	1	256	<input checked="" type="checkbox"/>

[Add another attribute](#)

[Back](#) [Next step](#)

Leave the default settings for password strength, user sign up and account expiration.

What password strength do you want to require?

Minimum length
8

☒ Require numbers
☒ Require special character
☒ Require uppercase letters
☒ Require lowercase letters

Do you want to allow users to sign themselves up?

You can choose to only allow administrators to create users or allow users to sign themselves up. [Learn more.](#)

☐ Only allow administrators to create users
☒ Allow users to sign themselves up

How quickly should user accounts created by administrators expire if not used?

You can choose for how long until a user account created by an administrator expires if the account is not used.

Days to expire
7

[Back](#) [Next step](#)

Leave the default settings for MFA and verification.

Do not create a role for sending SMS messages as we are not using MFA or phone number verification

Click "Next step"

Do you want to enable Multi-Factor Authentication (MFA)?

Multi-Factor Authentication (MFA) increases security for your end users. If you choose 'optional', individual users can have MFA enabled. You can only choose 'required' when initially creating a user pool, and if you do, all users must use MFA. Phone numbers must be verified if MFA is enabled. You can configure adaptive authentication on the Advanced security tab to require MFA based on risk scoring of user sign in attempts. [Learn more about multi-factor authentication.](#)

Note: separate charges apply for sending text messages.

☒ Off ☐ Optional ☐ Required

Do you want to require verification of emails or phone numbers?

Verification requires users to retrieve a code from their email or phone to confirm ownership. Verification of a phone or email is necessary to automatically confirm users and enable recovery from forgotten passwords. [Learn more about email and phone verification.](#)

☒ Email ☐ Phone Number

You must provide a role to allow Amazon Cognito to send SMS messages

Amazon Cognito needs your permission to send SMS messages to your users on your behalf. [Learn more about IAM roles.](#)

New role name

BackSpaceLab-SMS-Role

Create role

Back Next step

Change verification type to link

Give the email message a subject

Do you want to customize your email verification messages?

You can choose to send a code or a clickable link and customize the message to verify email addresses. [Learn more about email verification.](#)

Verification type

☐ Code ☒ Link

Email subject

Your verification link for BackSpace Cognito Lab

Email message

Please click the link below to verify your email address. {##Verify Email##}

You can customize the message above, but it must include the "{##Verify Email##}" placeholder, which will be replaced with the link.

Leave the invitation message as is

Do you want to customize your user invitation messages?

SMS message

Your username is {username} and temporary password is {####}.

You can customize the message above, but it must include the "{username}" and "{####}" placeholder, which will be replaced with the username and temporary password respectively.

Email subject

Your temporary password

Email message

Your username is {username} and temporary password is {####}.

You can customize the message above, but it must include the "{username}" and "{####}" placeholder, which will be replaced with the username and temporary password respectively.

Click "Next step"

Do you want to customize your email address?

You can send emails from an SES verified identity. [Learn more about SES verified identities and domains.](#)

- Add custom FROM address
- Add custom REPLY-TO address

Click "Next step"

Do you want to add tags for this user pool?

You can create new tags by entering tag keys and tag values below

[Add tag](#)

Click "Next step"

Do you want to remember your user's devices?

Click "Add an app client"

Which app clients will have access to this user pool?

The app clients that you add below will be given a unique ID and an optional secret key to access this user pool.

[Add an app client](#)

[Back](#) [Next step](#)

Check “Cognito User Pool”

Click on “Domain name”

Enter a unique domain prefix

▶ Creating an AWS Cognito ID Pool

In this section we will use the IAM service to create a role for Federated users to access their own private folder in a bucket on S3. We will then create an AWS Cognito ID Pool to allow AWS Security Token Service (STS) temporary credentials to be issued to federated users.

Create a website with Amazon S3

Before we create our Identity pool we need to create an S3 bucket to host our website. We will need to take note of the bucket name as we will use this in an IAM role later.

Clone or download and unzip the following Git repository:

<https://github.com/backspace-academy/aws-cognito-lab>

Open the S3 console

Create a bucket with a unique name

Click "Next"

Select "Grant public read access to this bucket"

Click “Next”

Create bucket

1 Name and region 2 Set properties 3 **Set permissions** 4 Review

Manage users

User ID	Objects	Object permissions
pcoady(Owner)	<input checked="" type="checkbox"/> Read <input checked="" type="checkbox"/> Write	<input checked="" type="checkbox"/> Read <input checked="" type="checkbox"/> Write

Access for other AWS account [+ Add account](#)

Account	Objects	Object permissions
---------	---------	--------------------

Manage public permissions

Grant public read access to this bucket

Warning: This bucket will have public read access.
Everyone in the world will have read access to this bucket.

Manage system permissions

Do not grant Amazon S3 Log Delivery group write access to this bucket

[Previous](#) [Next](#)

Click “Create Bucket”

Select the created bucket

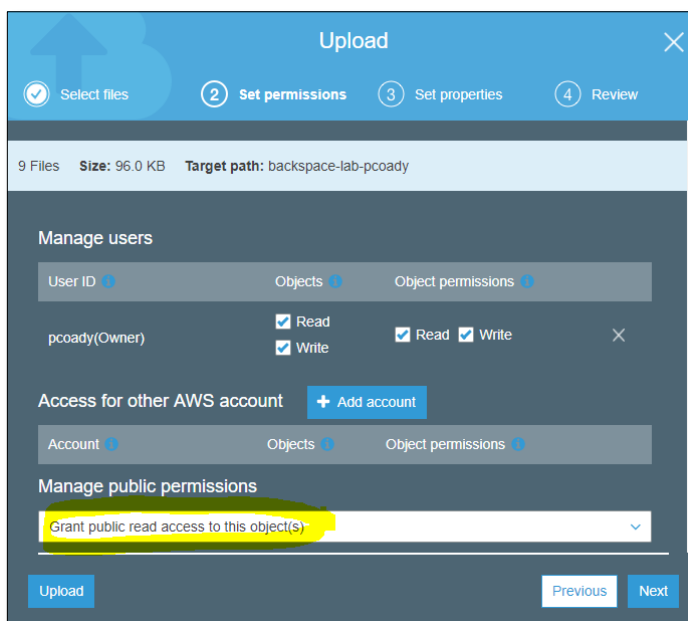

Click “Upload”

Drag and drop all the files and folders from the Git repository. Click “Next”

Select "Grant public read access to this object(s)"

Click "Next"

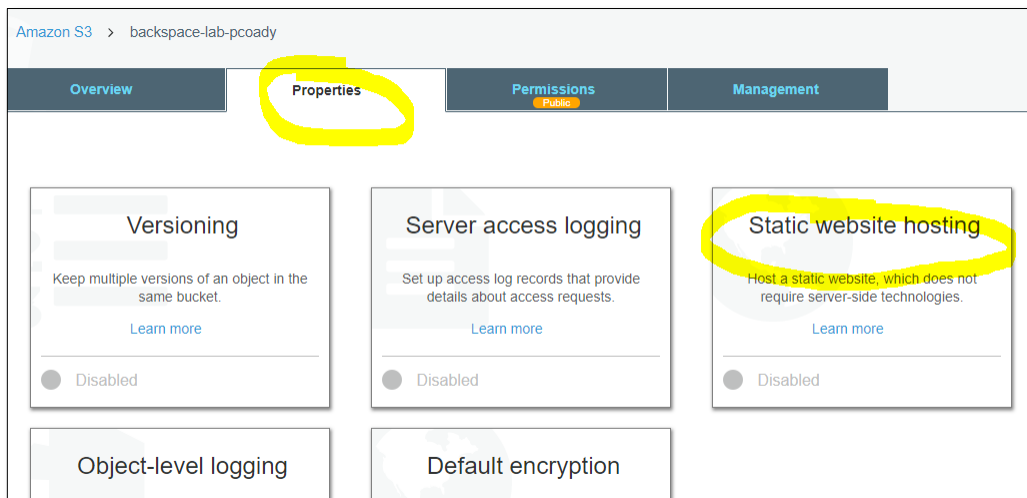

Click "Next"

Click "Upload"

Select the "Properties" tab

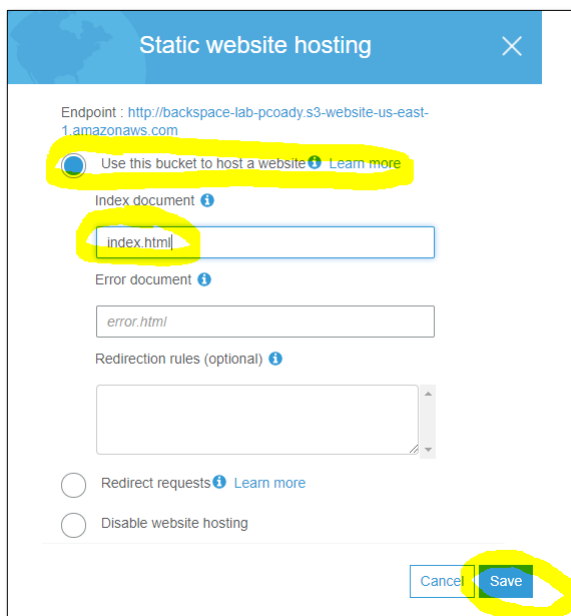

Select "Static website hosting"

Select "Use this bucket to host a website"

Add "index.html" for index document

Click "Save"

Select the "Permissions" tab

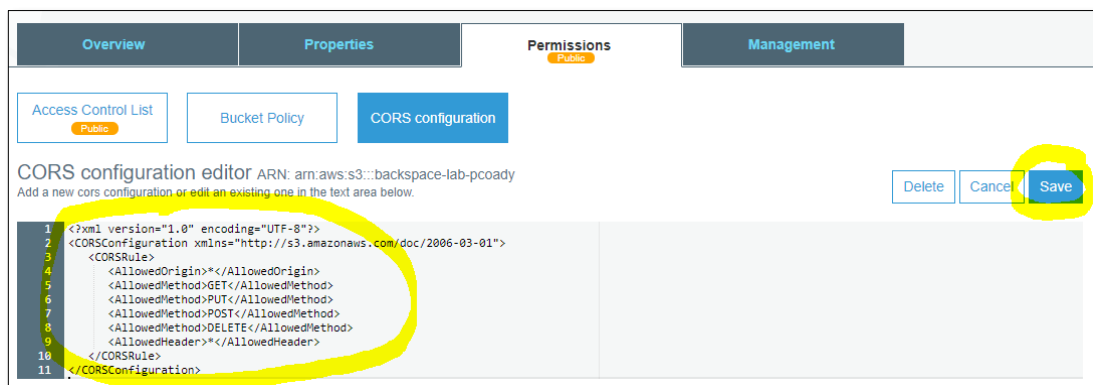

Select "CORS configuration"

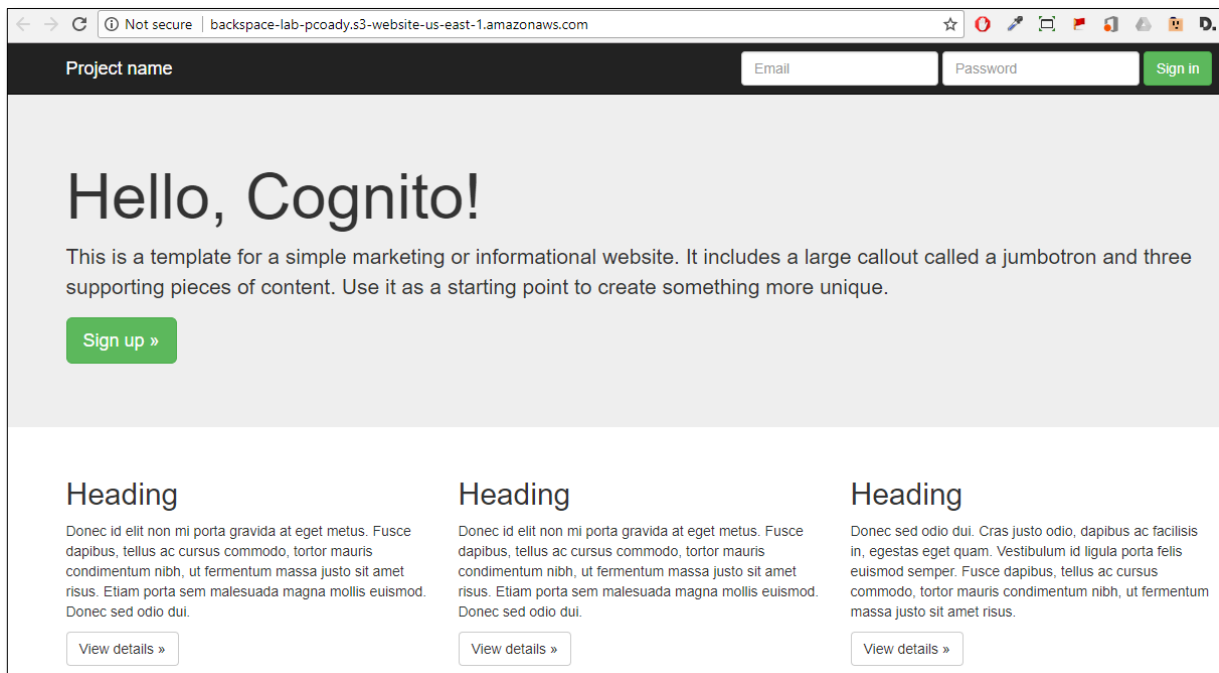

Paste the following policy XML

```
<?xml version="1.0" encoding="UTF-8"?>
<CORSConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
    <AllowedMethod>PUT</AllowedMethod>
    <AllowedMethod>POST</AllowedMethod>
    <AllowedMethod>DELETE</AllowedMethod>
    <AllowedHeader>*</AllowedHeader>
  </CORSRule>
</CORSConfiguration>
```

Click Save

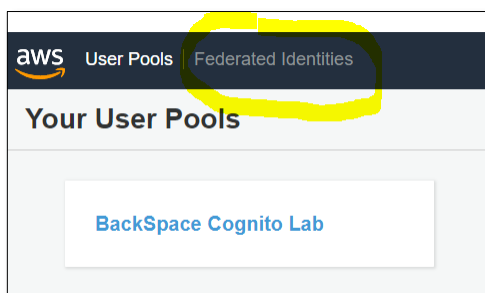

Navigate to the website endpoint with your browser to check the site is OK.

Creating a Cognito ID Pool

Go back to the Cognito console and select 'Federated Identities'

Give your identity pool a name

Expand 'Authentication Providers'

Enter the User Pool ID (the same as used in your code previously)

Enter the App client ID (the same as used in your code previously)

Click 'Create Pool'

▼ Authentication providers ⓘ

Amazon Cognito supports the following authentication methods with Amazon Cognito Sign-In or any public provider. If you allow your users to authenticate using any of these public providers, you can specify your application identifiers here. Warning: Changing the application ID that your identity pool is linked to will prevent existing users from authenticating using Amazon Cognito. [Learn more about public identity providers.](#)

Cognito Amazon Facebook Google+ Twitter / Digits OpenID SAML Custom

Configure your Cognito Identity Pool to accept users federated with your Cognito User Pool by supplying the User Pool ID and the App Client ID.

User Pool ID ✕
 ex: us-east-1_Ab129faBb

App client id
 ex: 7lhkkfbfb4q5kpp90urffao

[Add Another Provider](#)

* Required Cancel **Create Pool**

You will now be redirected to the IAM console

Expand 'View Details'

Click 'View Policy Document' for 'Your authenticated identities would like access to Cognito.'

Click Edit

Give the policy a name

Change the policy to include access to Amazon S3:

Make sure the dash is not lost in cognito-identity ({cognito-identity.amazonaws.com:sub}) if you cut and paste from the pdf!

  ]
}
```

[Cancel](#) [Allow](#)

You will now be redirected to the Cognito console

Take note of your Identity pool ID, you will need it later

Authenticating Cognito Users for a Web Application

In this section we will use the Cognito SDK for Javascript to create authentication capability for a web application.

Create a Cognito connected app

This part of the lab requires you to edit code in an IDE. The lectures used the free Atom IDE although you are welcome to use your preferred IDE of choice.

Open your local copy of index.html in Atom IDE (or any other IDE you prefer to use to edit code).

At the bottom you will see both the AWS Cognito Javascript and the AWS Javascript SDKs have been included as modules. It must load before our application code (app.js). The buttons are hidden and a spinner image is shown to ensure the buttons are not clicked while the SDK is loading.

```

<!-- AWS SDKs
===== -->

<!-- AWS Cognito Javascript SDK -->
<!-- Latest AWS Cognito Javascript SDK can be downloaded from AWS Amplify github repository:-->
<!-- https://raw.githubusercontent.com/aws/aws-amplify/master/packages/amazon-cognito-identity-js/dist/amazon-cognito-identity.min.js -->
<script src="./js/amazon-cognito-identity.min.js"></script>

<!-- AWS Javascript SDK -->
<!-- Latest AWS Javascript SDK can be downloaded from AWS Javascript SDK github repository:-->
<!-- https://raw.githubusercontent.com/aws/aws-sdk-js/master/dist/aws-sdk.min.js -->
<script src="./js/aws-sdk-2.211.0.min.js"></script>

<!-- Where the magic happens! -->
<script type="module" src="./js/app.js"></script>

```

The starting code for this lab will be in js/app.js

A copy of the completed code is at `js/app-final.js` in case you cannot get it working yourself.

Open your local copy of `js/app.js`

After the click event listeners add the following code.

Change the items in red to suit your user pool, id pool and app.

```

1. // Region must be defined
2. AWS.config.region = 'us-east-1';
3.
4. // User pool
5. var poolData = {
6.     UserPoolId : 'us-east-1_MYnlnSKp6', // Your user pool id here
7.     ClientId : '5d3s9jg6k9rupvjdd10rjr7h8j' // Your app client id here
8. };
9.
10. // Your identity pool id here
11. var identityPoolId = "us-east-1:eba34910-30e3-4b75-8540-8ee026e6c442"
12.
13. // Cognito Sync store name
14. var cognitoDatasetName = "backspace-users";
15.
16. var cognitoUser, identityId, cognitosync;
```

Now we will create the sign up function. We will pass the user pool id, username, password and attributes to `CognitoUserPool SignUp`. If successful we get the Cognito user object returned. If we have set up our User pool for verification of email then the user will be created but not confirmed until the verification link has been clicked.

```

1. // Sign Up
2. function signUp(){
3.     console.log('Starting Sign up process');
4.
5.     // Close the modal window
6.     $('#signUpModal').modal("hide");
7.
8.     // Get sign up information from modal
9.     var userLogin = {
10.         username : $('#inputPreferredUsername').val(),
11.         password : $('#inputPassword').val()
12.     }
13.
14.     var attributes = [
15.         {
16.             Name : 'given_name',
17.             Value : $('#inputGivenName').val()
18.         },
19.         {
20.             Name : 'family_name',
21.             Value : $('#inputFamilyName').val()
22.         },
23.         {
24.             Name : 'email',
25.             Value : $('#inputEmail').val()
26.         },
27.         {
28.             Name : 'preferred_username',
29.             Value : $('#inputPreferredUsername').val()

```

```

30.     },
31.     {
32.         Name : 'website',
33.         Value : $('#inputWebsite').val()
34.     },
35.     {
36.         Name : 'gender',
37.         Value : $('#inputGender').val()
38.     },
39.     {
40.         Name : 'birthdate',
41.         Value : $('#inputBirthdate').val()
42.     },
43.     {
44.         Name : 'custom:linkedin',
45.         Value : $('#inputLinkedin').val()
46.     }
47. ];
48.
49. var params = {
50.     ClientId: poolData.ClientId,    /* required */
51.     Password: userLogin.password, /* required */
52.     Username: userLogin.username, /* required */
53.     UserAttributes: attributes
54. };
55.
56. var cognitoidentityserviceprovider = new AWS.CognitoIdentityServiceProvider();
57. cognitoidentityserviceprovider.signUp(params, function(err, data) {
58.     if (err) {
59.         console.log(err, err.stack); // an error occurred
60.         alert('Error: ' + JSON.stringify(err));
61.     }
62.     else {
63.         console.log(JSON.stringify(data)); // successful response
64.         if (data.UserConfirmed) {
65.             bootbox.alert('Sign up successful.');

```

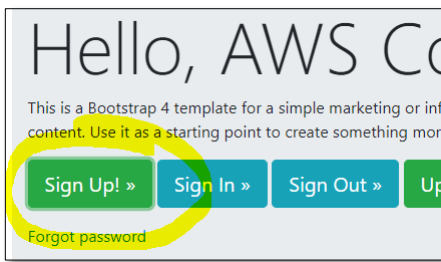

Upload the modified js/app.js to the S3 bucket

Make sure the object has public permissions

Clear your browser cache

Go to the S3 website url

Click on “Sign Up”

Enter the profile details

Click "Sign Up"

A screenshot of a registration form titled "BackSpace Academy". The form has several input fields: "Family Name" (with "Coady" entered), "Preferred Username" (with "pcoady" entered), "Website" (with "whatever.com" entered), "Gender" (with "male" selected), "Birthdate" (with "11/10/1967" entered), and "LinkedIn profile page" (with "whatever.com" entered). At the bottom right of the form, there are two buttons: "Cancel" and "Sign Up! »". The "Sign Up! »" button is circled in yellow.

You will now receive a message to check your email

Go to your email and click on the link to confirm your email address

Now create the signIn function. If an error with message 200 (OK) is returned we need to check whether the sign in was successful by calling getCurrentUser.

```

1. // Sign In
2. function signIn(){
3.   var authenticationData = {
4.     Username : $('#inputUsername').val(), // Get username & password from modal
5.     Password : $('#inputPassword2').val()
6.   };
7.   $('#signInModal').modal("hide"); // Close the modal window
8.   var authenticationDetails = new AmazonCognitoIdentity.AuthenticationDetails(authenticationData
9. );
10.  var userPool = new AmazonCognitoIdentity.CognitoUserPool(poolData);
11.  var userData = {
12.    Username : authenticationData.Username,
13.    Pool : userPool
14.  };
15.  cognitoUser = new AmazonCognitoIdentity.CognitoUser(userData);
16.  cognitoUser.authenticateUser(authenticationDetails, {
17.    onSuccess: function (result) {
18.      createCredentials(result.getIdToken().getJwtToken());
19.      console.log("Signed in successfully");
20.    },
21.    onFailure: function(err) {
22.      if (err.message == '200'){ // 200 Success return
23.        cognitoUser = userPool.getCurrentUser();
24.        if (cognitoUser != null) {
25.          cognitoUser.getSession(function (err, result) { // Get ID token from session
26.            if (err) {
27.              alert(err);
28.            }
29.            if (result) {
30.              createCredentials(result.getIdToken().getJwtToken());
31.              console.log("Signed to CognitoID in successfully");
32.            }
33.          });
34.        }
35.        else {
36.          alert(JSON.stringify(err));
37.        }
38.      }
39.      else {
40.        alert(JSON.stringify(err));
41.      }
42.    },
43.  });

```

Now create a function get AWS Security Token Service (STS) temporary credentials with ID token from Cognito ID. We do this using CognitoIdentityCredentials in the Javascript SDK and passing pool id and federated login information. Change the Logins in red to suit your user pool id.

We then have to refresh the credentials before we can use them.

```

1.  function createCredentials(idToken) {
2.      AWS.config.credentials = new AWS.CognitoIdentityCredentials({
3.          IdentityPoolId: identityPoolId,
4.          Logins : {
5.              // Change the key below according to the specific region your user pool is in.
6.              'cognito-idp.us-east-1.amazonaws.com/us-east-1_MYnlnSKp6' : idToken
7.          }
8.      });
9.      //refreshes credentials using AWS.CognitoIdentity.getCredentialsForIdentity()
10.     AWS.config.credentials.refresh((error) => {
11.         if (error) {
12.             console.error(error);
13.         } else {
14.             // Instantiate aws sdk service objects now that the credentials have be
15.             en updated.
16.             // example: var s3 = new AWS.S3();
17.             console.log('Successfully logged!');
18.         }
19.     });
20. }

```

Upload the modified js/app.js to the S3 bucket

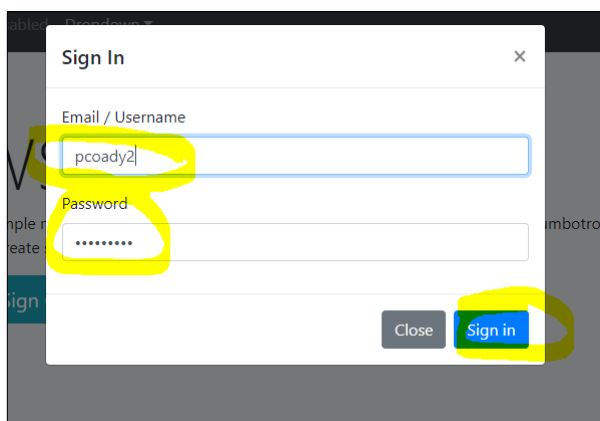

Make sure the object has public permissions

Clear your browser cache

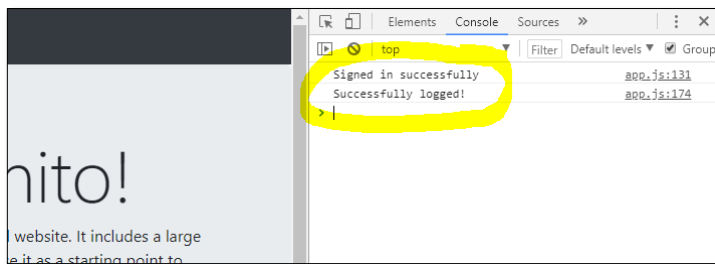

Go to the S3 website url

Click on “Sign In”

Enter your sign in details and click “Sign in”

Press F12 to see the console output

Now we will create the signOut function.

There are two options for signing out. A standard sign out and a global sign out that invalidates any tokens in Cognito.

```

1.  function signOut() {
2.      if (cognitoUser !== null) {
3.          bootbox.confirm({
4.              title: "Sign out",
5.              message: "Do you want to also invalidate all user data on this device?",
6.              buttons: {
7.                  cancel: {
8.                      label: '<i class="fa fa-times"></i> No'
9.                  },
10.                 confirm: {
11.                     label: '<i class="fa fa-check"></i> Yes'
12.                 },
13.             },
14.             callback: function (result) {
15.                 if (result) {
16.                     cognitoUser.globalSignOut({
17.                         onSuccess: function (result) {
18.                             bootbox.alert("Successfully signed out and invalidated all app r
19.                             eords.");
20.                         },
21.                         onFailure: function(err) {
22.                             alert(JSON.stringify(err));
23.                         }
24.                     });
25.                 }
26.                 else {
27.                     cognitoUser.signOut();
28.                     bootbox.alert("Signed out of app.");
29.                 }
30.             });
31.         }
32.         else {
33.             bootbox.alert("You are not signed in!");
34.         }
35.     }

```

Upload the modified js/app.js to the S3 bucket

Make sure the object has public permissions

Clear your browser cache

Go to the S3 website url

Click on "Sign Out"

Now create the updateProfile function.

```

1. function updateProfile(){
2.   if (cognitoUser !== null) {
3.     console.log('Starting update process');
4.
5.     var attributes = [
6.       {
7.         Name : 'given_name',
8.         Value : $('#inputGivenName2').val()
9.       },
10.      {
11.        Name : 'family_name',
12.        Value : $('#inputFamilyName2').val()
13.      },
14.      {
15.        Name : 'website',
16.        Value : $('#inputWebsite2').val()
17.      },
18.      {
19.        Name : 'gender',
20.        Value : $('#inputGender2').val()
21.      },
22.      {
23.        Name : 'birthdate',
24.        Value : $('#inputBirthdate2').val()
25.      },
26.      {
27.        Name : 'custom:linkedin',
28.        Value : $('#inputLinkedin2').val()
29.      }
30.    ];
31.
32.    console.log("Adding attributes");

```

```

33.     var attributeList = [];
34.     for (var a=0; a<attributes.length; ++a){
35.         var attributeTemp = new AmazonCognitoIdentity.CognitoUserAttribute(attributes[a]);
36.         attributeList.push(attributeTemp);
37.     }
38.     console.log("Updating profile");
39.     $('#updateModal').modal("hide"); // Close the modal window
40.     cognitoUser.updateAttributes(attributeList, function(err, result) {
41.         if (err) {
42.             alert(JSON.stringify(err.message));
43.             return;
44.         }
45.         console.log('call result: ' + JSON.stringify(result));
46.         bootbox.alert("Successfully updated!");
47.     });
48.     }
49.     else {
50.         bootbox.alert("You are not signed in!");
51.     }
52. }

```

Upload the modified js/app.js to the S3 bucket

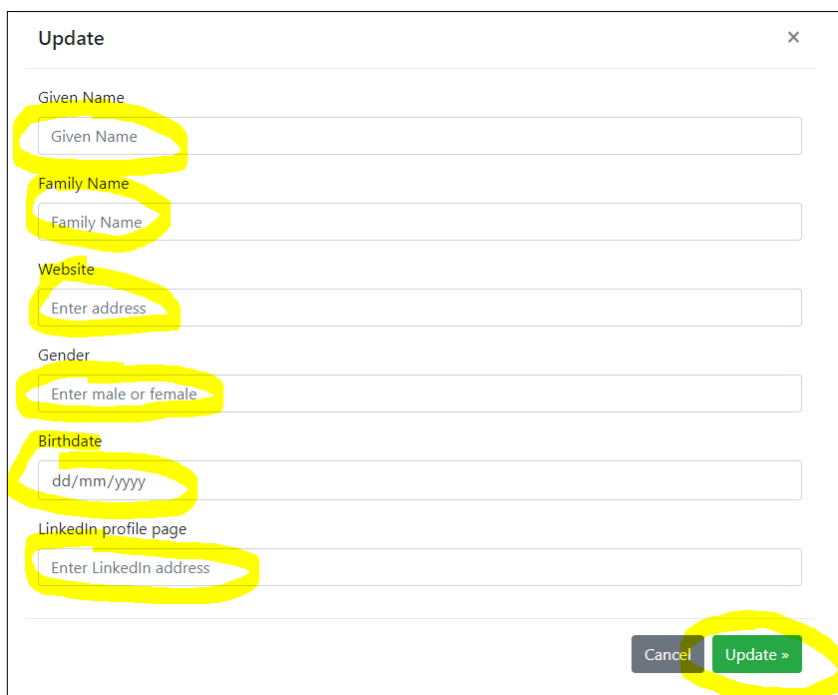

Make sure the object has public permissions

Clear your browser cache

Go to the S3 website url

Click on "Update Profile"

Enter new profile details

The image shows a web application modal titled "Update" with a close button (X) in the top right corner. The modal contains several input fields, each with a label above it. The labels and their corresponding input fields are: "Given Name" (input field with placeholder "Given Name"), "Family Name" (input field with placeholder "Family Name"), "Website" (input field with placeholder "Enter address"), "Gender" (input field with placeholder "Enter male or female"), "Birthdate" (input field with placeholder "dd/mm/yyyy"), and "Linkedin profile page" (input field with placeholder "Enter LinkedIn address"). At the bottom right of the modal, there are two buttons: a grey "Cancel" button and a green "Update =" button. All these elements (the labels, input fields, and buttons) are circled in yellow.

Now create the forgotPassword function

```

1.  function forgotPassword(){
2.      var verificationCode, newPassword, forgotUser;
3.      console.log('Forgot Password');
4.      bootbox.prompt("Enter username or email", function(result){
5.          console.log("User: " + result);
6.          forgotUser = result;
7.          var userPool = new AmazonCognitoIdentity.CognitoUserPool(poolData);
8.          var userData = {
9.              Username : forgotUser,
10.             Pool : userPool
11.         };
12.         console.log("Creating user " + JSON.stringify(userData));
13.         cognitoUser = new AmazonCognitoIdentity.CognitoUser(userData);
14.         cognitoUser.forgotPassword({
15.             onSuccess: function (data) {
16.                 // successfully initiated reset password request
17.                 console.log('CodeDeliveryData from forgotPassword: ' + data);
18.             },
19.             onFailure: function(err) {
20.                 console.log(JSON.stringify(err.message));
21.             },
22.             //Optional automatic callback
23.             inputVerificationCode: function(data) {
24.                 console.log('Code sent to: ' + JSON.stringify(data));
25.                 bootbox.prompt('Please input verification code', function(result){
26.                     verificationCode = result;
27.                     bootbox.prompt('Enter new password ', function(result){
28.                         newPassword = result;
29.                         cognitoUser.confirmPassword(verificationCode, newPassword, {
30.
31.                             onSuccess() {
32.                                 console.log('Password confirmed!');
33.                                 bootbox.alert('Password confirmed!');
34.                             },
35.                             onFailure(err) {
36.                                 console.log(JSON.stringify(err.message));
37.                             }
38.                         });
39.                     });
40.                 }
41.             });
42.         });
43.     }

```

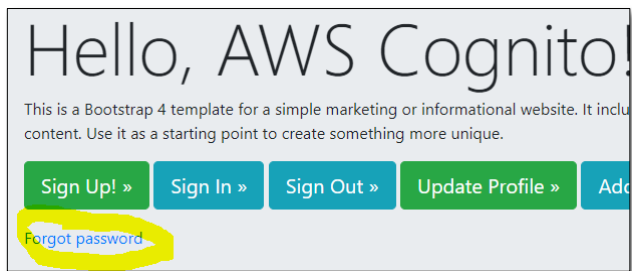

Upload the modified js/app.js to the S3 bucket

Make sure the object has public permissions

Clear your browser cache

Go to the S3 website url

Click on "Forgot password"

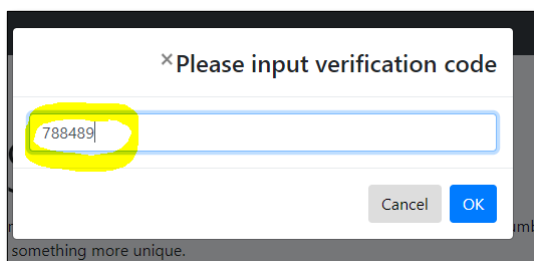

Enter username or email

Click OK

A verification code will be sent to your email.

Enter the verification code

Enter a password

Your password will be confirmed

Saving User Data across Devices with Cognito Sync

In this section we will use the Cognito SDK for Javascript to create an AWS CognitoSync key store for saving user information synchronized across devices.

Get CognitoSync Session Token

Now that we have our CognitoID credentials we can use these to access CognitoSync. First we need to use our new temporary credentials to create a CognitoSync session token.

We are going to create a new function to get our CognitoSync session token.

In order to get the token we must make a call to list records. If our dataset doesn't exist (as is the case now) it will be created automatically. We also get the sync count for the dataset which is needed later to add or change dataset records.

Now lets create the function:

```

1.  function getCognitoSynToken(){
2.      /* Other AWS SDKs will automatically use the Cognito Credentials provider */
3.      /* configured in the JavaScript SDK. */
4.      var cognitoSyncToken, cognitoSyncCount;
5.      identityId = AWS.config.credentials.identityId;
6.      cognitosync = new AWS.CognitoSync();
7.      cognitosync.listRecords({
8.          DatasetName: cognitoDatasetName, /* required */
9.          IdentityId: identityId, /* required */
10.         IdentityPoolId: identityPoolId /* required */
11.     }, function(err, data) {
12.         if (err) console.log("listRecords: " + err, err.stack); /* an error occurred */
13.         else {
14.             console.log("listRecords: " + JSON.stringify(data));
15.             cognitoSyncToken = data.SyncSessionToken;
16.             cognitoSyncCount = data.DatasetSyncCount;
17.             console.log("SyncSessionToken: " + cognitoSyncToken); /* successful respon
18.         se */
19.             console.log("DatasetSyncCount: " + cognitoSyncCount);
20.             addRecord(cognitoSyncToken, cognitoSyncCount);
21.         }
22.     });
23. }

```

Now that we have our CognitoSync session token we can use this to add, modify or delete CognitoSync dataset records.

To demonstrate we are going to call `addRecord` to add a record. Now lets add a record called 'USER_ID' that stores the users Cognito ID. We need to not only pass the CognitoSync session token but also the syncount that we got from the call to `listRecords`.

```

1. function addRecord(cognitoSyncToken, cognitoSyncCount){
2.     var params = {
3.         DatasetName: cognitoDatasetName, /* required */
4.         IdentityId: identityId, /* required */
5.         IdentityPoolId: identityPoolId, /* required */
6.         SyncSessionToken: cognitoSyncToken, /* required */
7.         RecordPatches: [
8.             {
9.                 Key: 'USER_ID', /* required */
10.                Op: 'replace', /* required */
11.                SyncCount: cognitoSyncCount, /* required */
12.                Value: identityId
13.            }
14.        ]
15.    };
16.    console.log("UserID: " + identityId);
17.    cognitosync.updateRecords(params, function(err, data) {
18.        if (err) {
19.            console.log("updateRecords: " + err, err.stack); /* an error occurred */
20.        }
21.        else {
22.            console.log("Value: " + JSON.stringify(data)); /* successful response */
23.        }
24.    });
25. }

```

Accessing AWS Resources with Cognito ID Credentials

In this section we will use the temporary credentials created by Security Token Service (STS) to access an Amazon S3 bucket.

The role we created for the Cognito ID pool allowed access to S3. Federated users can securely access a folder in the website bucket with the name of their Cognito ID.

First we need to get the identity ID (AWS.config.credentials.identityId) to create the prefix for the file path. Next we will use putObject to save an object with data to the user's personal folder.

```

1.  function createObject(){
2.      if (cognitoUser != null) {
3.          console.log("Creating S3 object");
4.          identityId = AWS.config.credentials.identityId;
5.          var prefix = 'cognito/backspace-academy/' + identityId;
6.          var key = prefix + '/' + 'test' + '.json';
7.          console.log('Key: ' + key)
8.          var data = {
9.              'test': 'It worked!'
10.         }
11.         var temp = JSON.stringify(data);
12.         var bucketName = 'backspace-lab-pcoady';
13.         var objParams = {
14.             Bucket: bucketName,
15.             Key: key,
16.             ContentType: 'json',
17.             Body: temp
18.         };
19.         // Save data to S3
20.         var s3 = new AWS.S3({
21.             params: {
22.                 Bucket: bucketName
23.             }
24.         });
25.         s3.putObject(objParams, function (err, data) {
26.             if (err) {
27.                 console.log('Error saving to cloud: ' + err);
28.                 alert('danger','Error.','Unable to save data to S3.');
```

▶ Building a Customised AWS SDK for Javascript version

In this section we will use the AWS SDK for Javascript builder service to create a customised version of the AWS SDK for Javascript.

Go to the AWS SDK for Javascript Builder at:

<https://sdk.amazonaws.com/builder/js/>

Click "Clear all"

Press Ctrl/Cmd F to find on the page

Find "Cognito"

Customize and Download
Build your own version of the AWS SDK for JavaScript

Choose a core version: 2.213.1

Select default services | Select all services | Clear all

AWS.STS 2011-06-15	AWS.CognitoIdentity 2014-06-30	AWS.ACM 2015-12-08
